weathernews

*Always **WITH** you!*

- Motivation
 - **Additional development for:**
 - + Frequency allocation in any of countries
 - + Interference reduction / prevention by waveform
- Capability of our weather radar “EAGLE RADAR”
- Applications for EAGLE RADAR
- Concluding Remarks

- In order to deploy our radars into any of countries, radar frequency should be the same, but not...
 - **The frequency allocations in countries are very different**

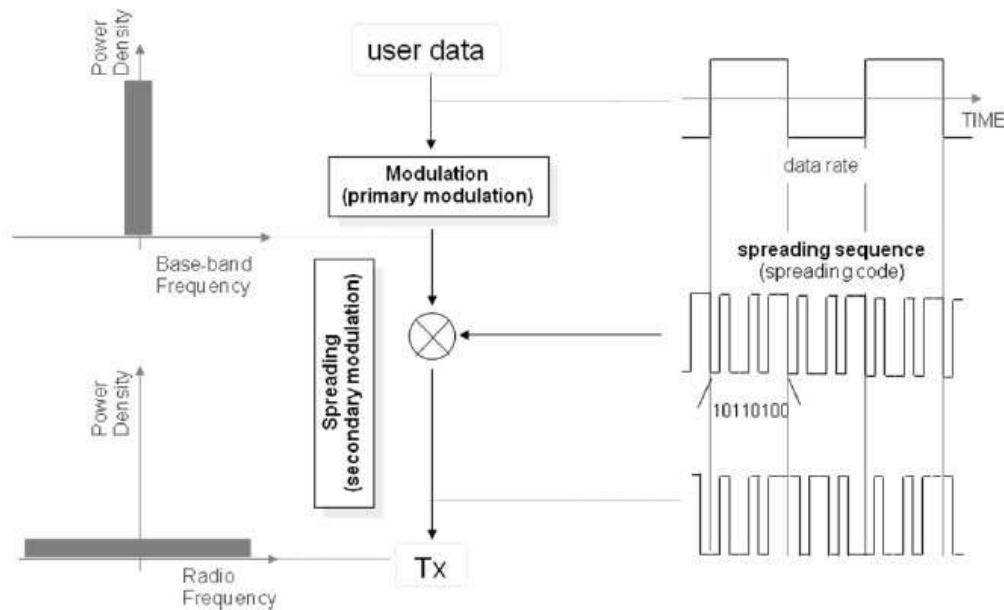

- Each country have their own rules about FA
- ITU organizes the rules and enlightens each country
- ITU's rules are basically assigned to the local rules

- In order to deploy our radars into any of countries, radar frequency should be the same, but not...
 - **The frequency allocations in countries are very different**
- ITU's functions are:
 - **Prioritize usage of frequency band. Ex.) 9.3-9.5GHz**
 - + Radio-allocation service (Marine & Airborne)
 - + Radio-determination service (Weather radar)
- If Wx-radar interferes Marine radar, Wx-radar cannot get frequency allocation and stop to transmit!
- Our radars never interfere in both Marine and Airborne radars AND undergo interferences from both...

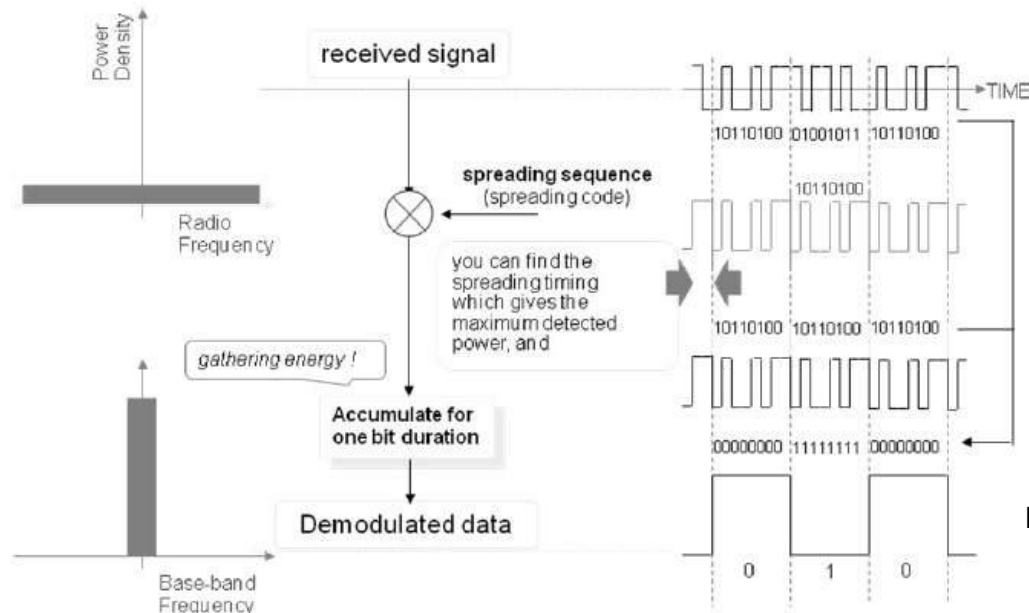

- Additionally, ITU has no rules about X-band Solid-state transmitter, 9.7-9.8GHz fq-band usage Japan uses for Wx-radars
- We have to submit our band-plan to ITU through WMO, *easy to deploy!!!*

- Our radars never interfere in both Marine and Airborne radars AND undergo interferences from both...
 - Typically, Wx-radar uses no-modulation / (Non-)Linear frequency modulation
 - For example, cellular phones use “Code Divided Multiple Access (CDMA)” w/o interferences each other
 - How about applying CDMA into each pulse???

What is CDMA?

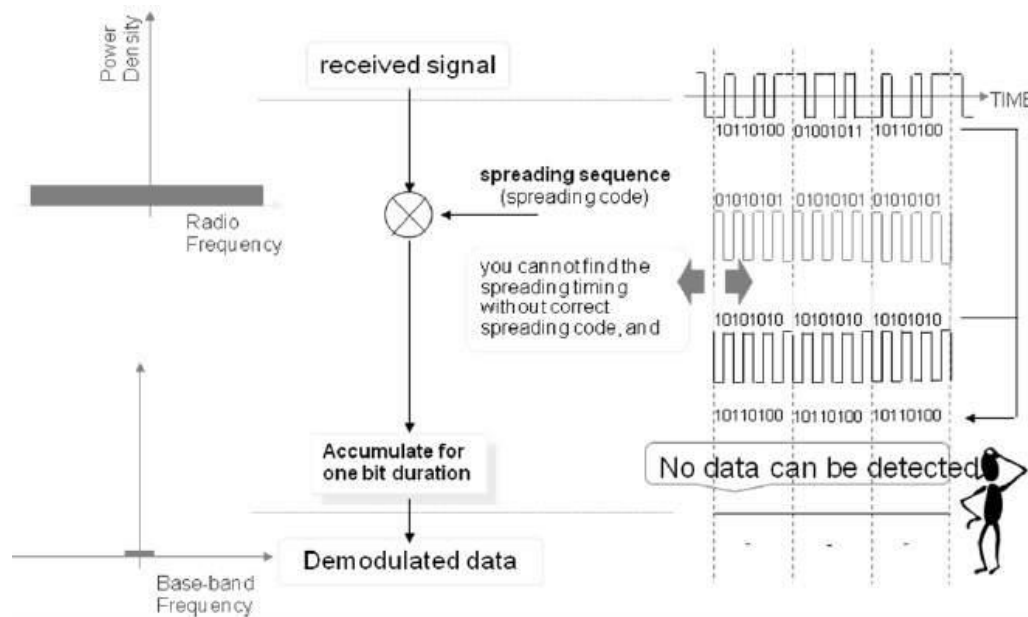

Modulation Process

Demodulation Process

https://www.tutorialspoint.com/cdma/cdma_spread_spectrum.htm

What is CDMA?

Demodulation of different-coded signal

- CDMA will help to decode only code-matched signal, non-decode others
- CDMA has many code sets and we can change the code in each pulse (c.f. barker code)

- Many researches have conducted, using barker code (gold sequence (Cai et al., 2010) and polyphase (Qazi and Fam, 2015)
- Application for weather radar (Mudukutore et al., 1998, Nguyen and Chandrasekar, 2014)
 - **Barker code (Mudukutore 1998)**
- No application for Wx-radar has been conducted using CDMA code

- Effectiveness of code modulation for Wx-radar
 - **CDMA, using GPS Course / Acquisition (C/A) code**
 - **32 code sets used for GPS**
- Range sidelobe depression & Doppler shift resolution (Autocorrelation)
- Interference between different codes, code and no-modulation, and code and LFM
 - **Frequency allocation, especially in Japan**

- Characteristics of matched filter between different modulations
 - Freq. 9.47GHz, PW. 20 μ s,
 - GPS codes: Nr 22 and 1, code length. 1023, sampling freq. 51MHz,

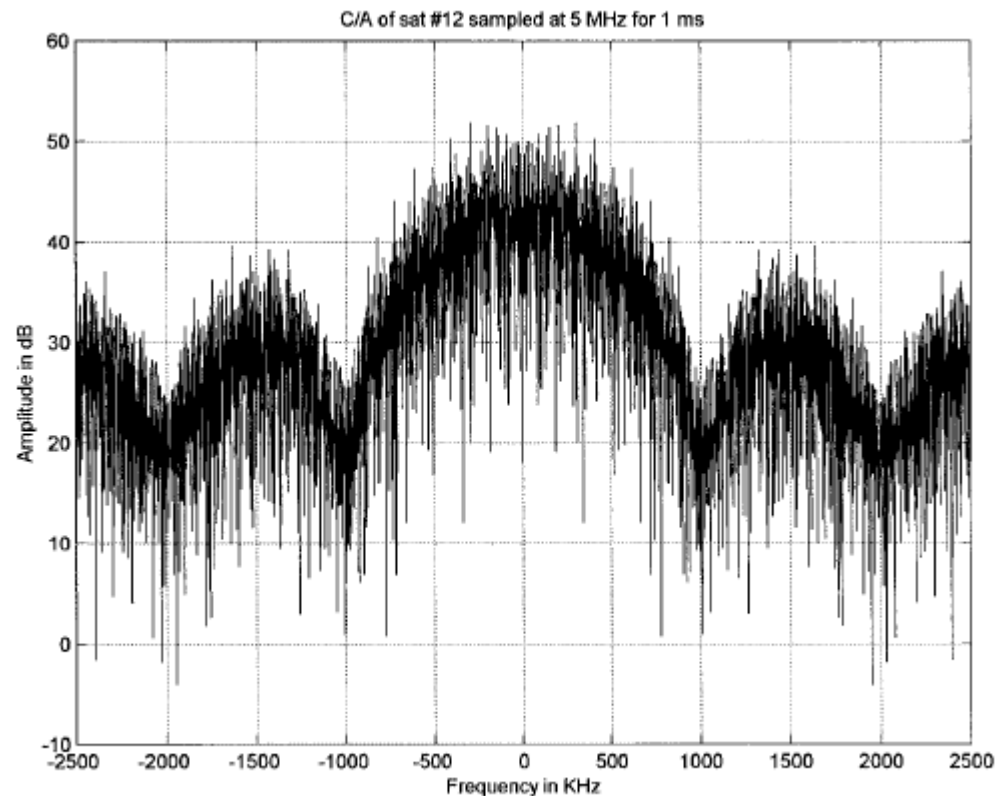

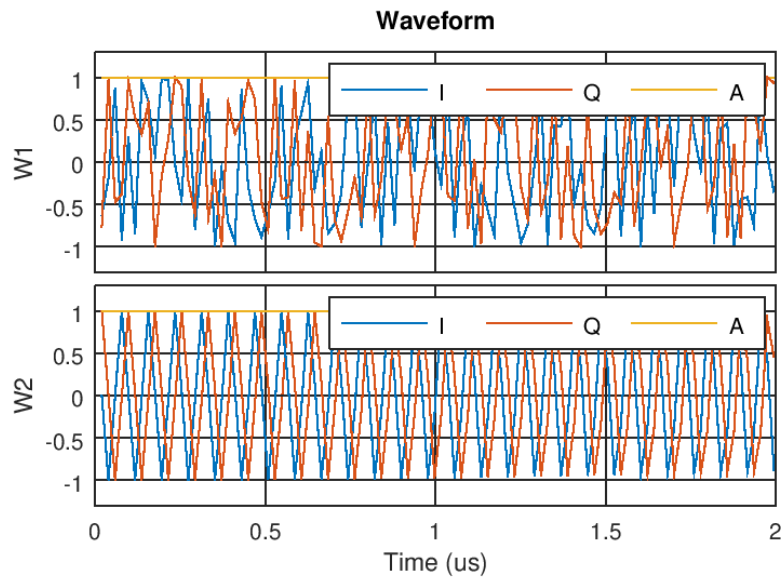

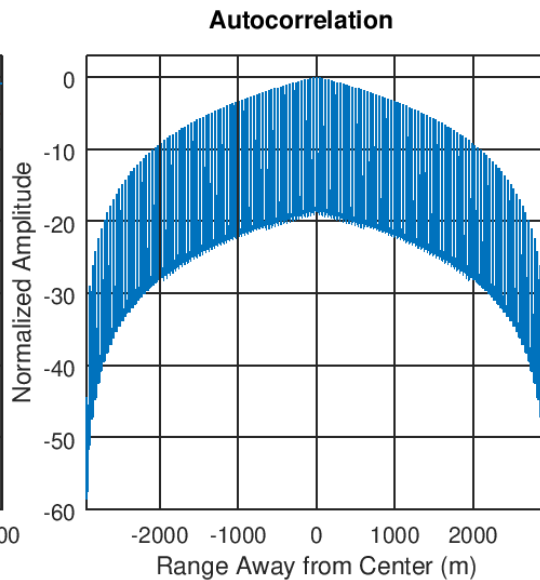

FIGURE 5.2 Spectrum of a C/A code.

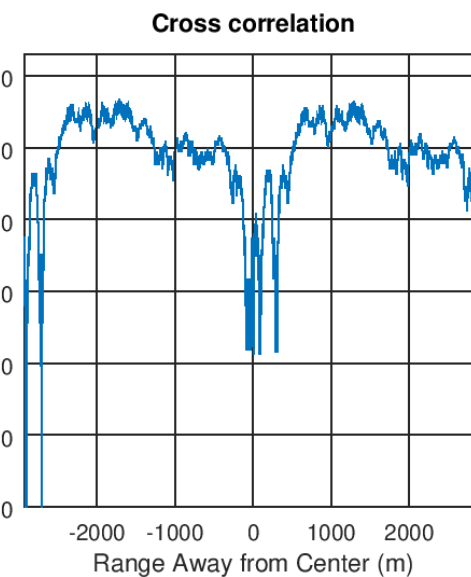

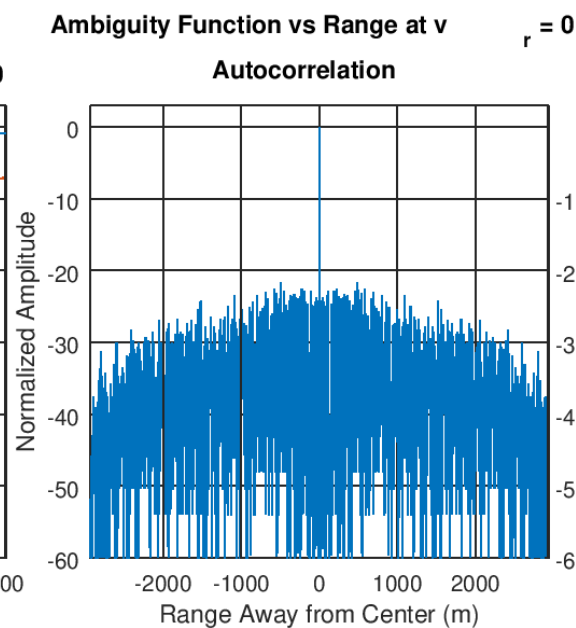

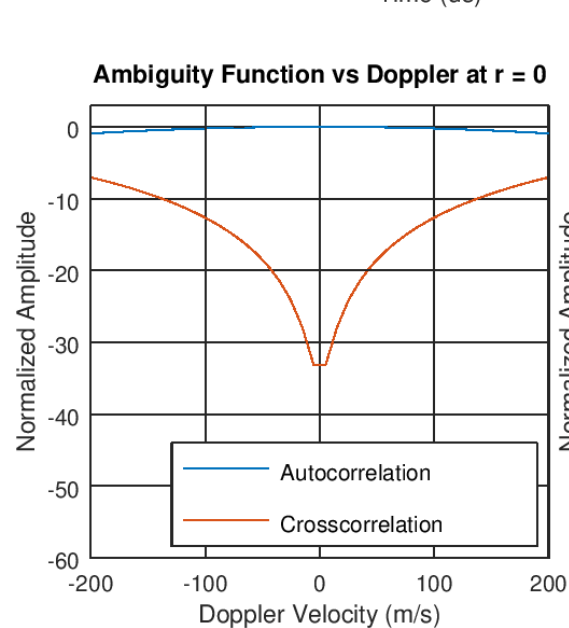

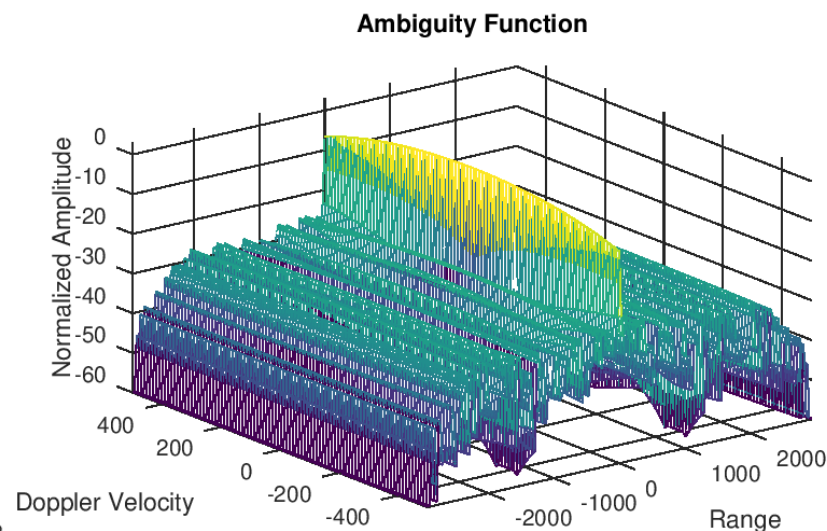

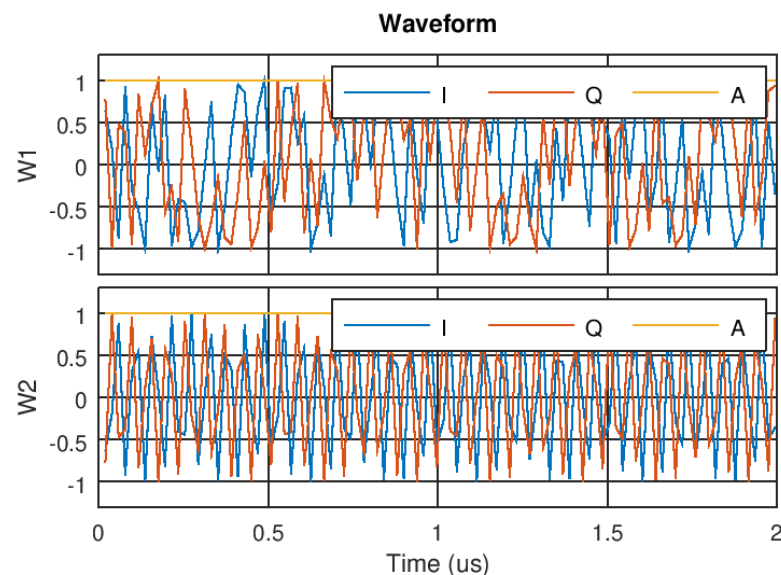

Barker code (rep) and No-modulation

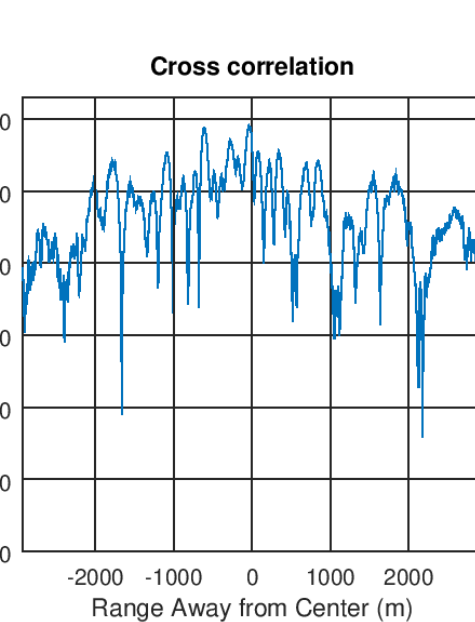

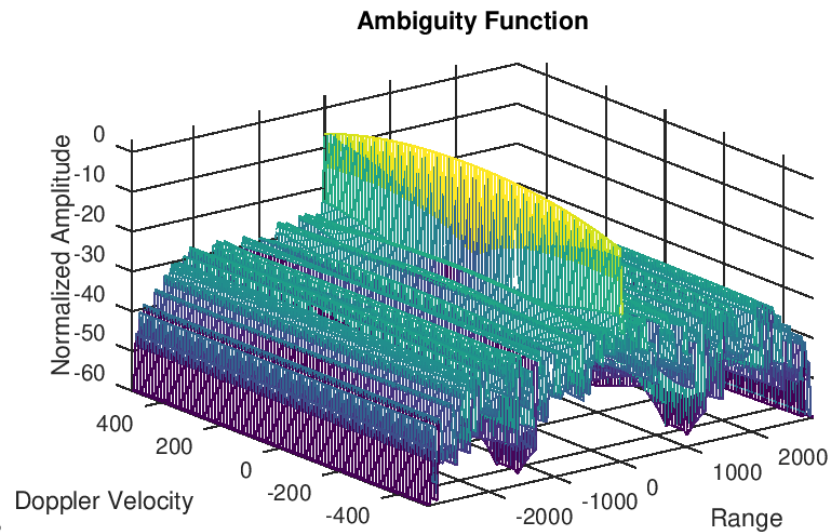

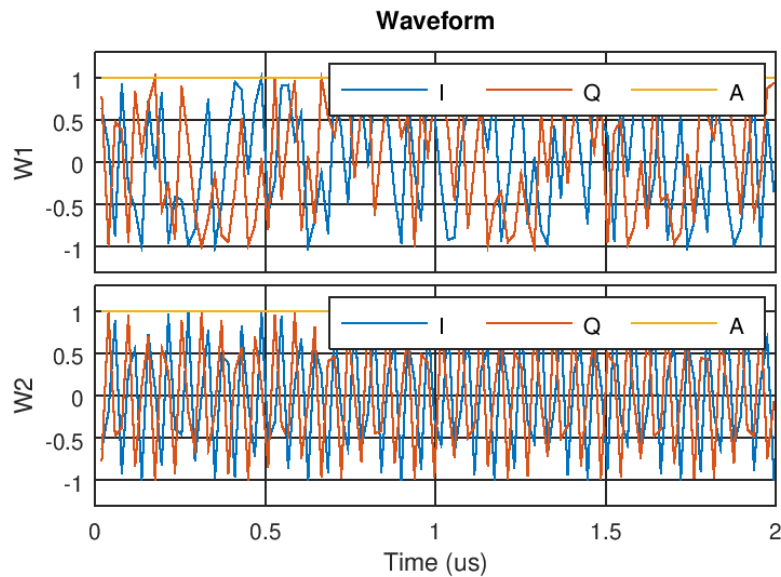

Ambiguity Function vs Range at $v_r = 0$

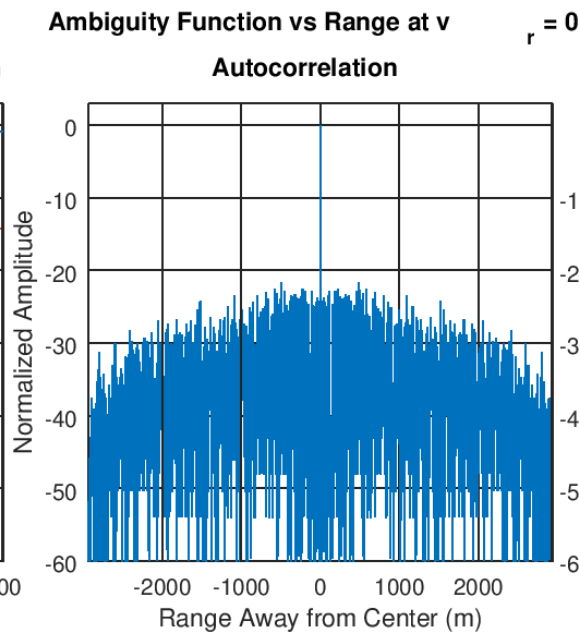

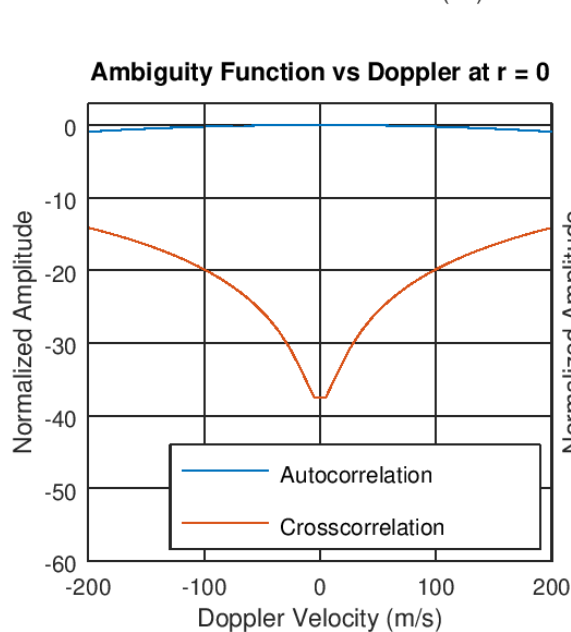

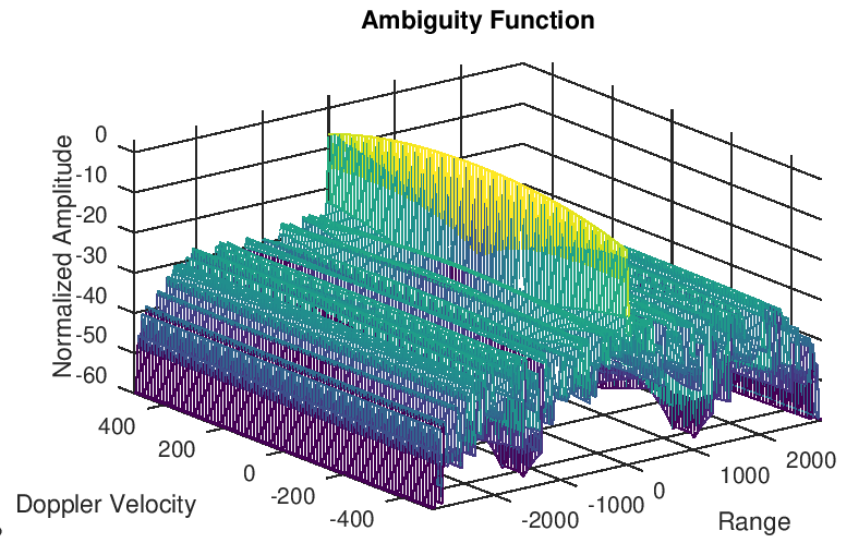

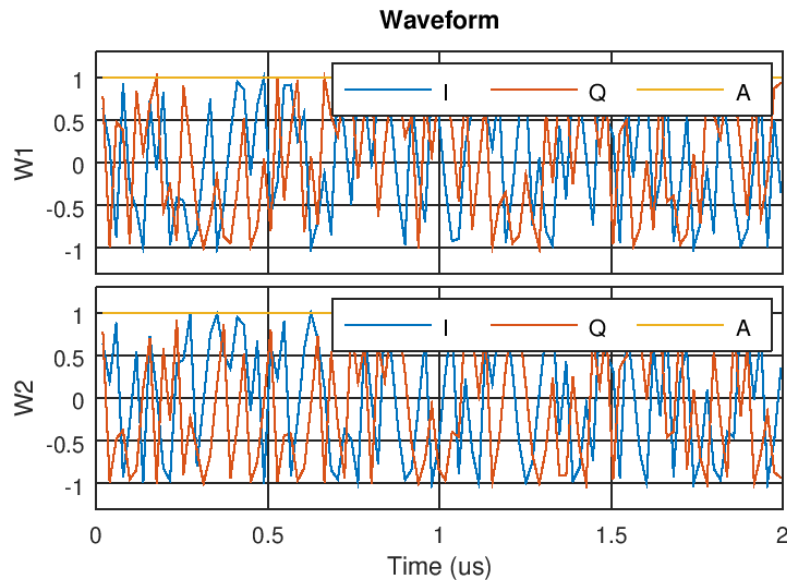

GPS code (22) and No-modulation

GPS code (22) and LFM

GPS code (22) and code (1)

- Good range sidelobe suppression w/ GPS code
- Large interference from other modulation...
 - **GPS jamming**
- Limited bandwidth due to frequency allocation (~20 MHz)
